

# Panduan Pemaketan Debian

Lucas Nussbaum

`packaging-tutorial@packages.debian.org`

versi 0.16 – 2015-12-26

# Tentang panduan ini

- ▶ Tujuan: **memberikan Anda pengetahuan penting untuk membuat paket Debian**
  - ▶ Modifikasi paket yang telah ada
  - ▶ Membuat paket Anda sendiri
  - ▶ Berinteraksi dengan komunitas Debian
  - ▶ Menjadi pengguna mahir Debian
- ▶ Ini mencakup aspek yang paling penting, tetapi tidak lengkap
  - ▶ Anda perlu membaca dokumentasi lainnya
- ▶ Sebagian besar dari panduan ini juga berlaku untuk distribusi turunan Debian
  - ▶ Termasuk juga Ubuntu

# Garis besar

# Outline

# Debian

- ▶ **distribusi GNU/Linux**
- ▶ 1st major distro developed “openly in the spirit of GNU”
- ▶ **Non-commercial**, built collaboratively by over 1,000 volunteers
- ▶ 3 main features:
  - ▶ **Quality** – culture of technical excellence  
*We release when it's ready*
  - ▶ **Freedom** – devs and users bound by the *Social Contract*  
Promoting the culture of Free Software since 1993
  - ▶ **Independence** – no (single) company babysitting Debian  
And open decision-making process (*do-ocracy* + *democracy*)
- ▶ **Amateur** in the best sense: done for the love of it

# paket Debian

- ▶ **.deb** files (binary packages)
- ▶ A very powerful and convenient way to distribute software to users
- ▶ One of the two most common package formats (with RPM)
- ▶ Universal:
  - ▶ 30,000 binary packages in Debian  
→ most of the available free software is packaged in Debian!
  - ▶ For 12 ports (architectures), including 2 non-Linux (Hurd; KFreeBSD)
  - ▶ Also used by 120 Debian derivative distributions

# Format paket Deb

- ▶ .deb file: an ar archive

```
$ ar tv wget_1.12-2.1_i386.deb
rw-r--r-- 0/0      4 Sep  5 15:43 2010 debian-binary
rw-r--r-- 0/0    2403 Sep  5 15:43 2010 control.tar.gz
rw-r--r-- 0/0  751613 Sep  5 15:43 2010 data.tar.gz
```

- ▶ debian-binary: version of the deb file format, "2.0\n"
  - ▶ control.tar.gz: metadata about the package  
control, md5sums, (pre|post)(rm|inst), triggers, shlibs,...
  - ▶ data.tar.gz: data files of the package
- 
- ▶ You could create your .deb files manually  
[http://tldp.org/HOWTO/html\\_single/Debian-Binary-Package-Building-HOWTO/](http://tldp.org/HOWTO/html_single/Debian-Binary-Package-Building-HOWTO/)
  - ▶ But most people don't do it that way

**This tutorial: create Debian packages, the Debian way**

# Perkakas yang anda perlukan

- ▶ Sebuah sistem Debian (atau Ubuntu) (dengan akses root)
- ▶ Some packages:
  - ▶ **build-essential**: has dependencies on the packages that will be assumed to be available on the developer's machine (no need to specify them in the `Build-Depends`: control field of your package)
    - ▶ includes a dependency on **dpkg-dev**, which contains basic Debian-specific tools to create packages
  - ▶ **devscripts**: contains many useful scripts for Debian maintainers

Banyak perkakas lain yang akan diperlukan nantinya, seperti **debhelper**, **cdb**s, **quilt**, **pbuilder**, **sbuild**, **lintian**, **svn-buildpackage**, **git-buildpackage**,

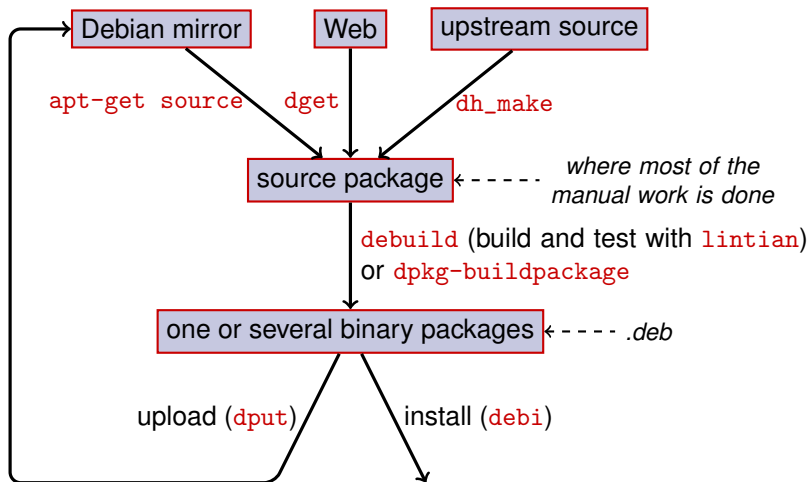

...

Pasang semua bila Anda menginginkannya.

# General packaging workflow

## Contoh: membangun kembali paket dash

- 1 Pasang paket yang dibutuhkan untuk membangun paket dash, dan devscripts

```
sudo apt-get build-dep dash
```

(requires deb-src lines in /etc/apt/sources.list)

```
sudo apt-get install --no-install-recommends devscripts fakeroot
```
- 2 Buat direktori kerja Anda, dan masuk ke direktori tersebut:

```
mkdir /tmp/debian-tutorial ; cd /tmp/debian-tutorial
```
- 3 Ambil paket source dash

```
apt-get source dash
```

(Anda memerlukan baris deb-src pada /etc/apt/sources.list)
- 4 Bangun paket

```
cd dash-*
```

```
debuild -us -uc
```

(-us -uc matikan penandatanganan paket dengan GPG)
- 5 Periksa apakah berjalan dengan baik
  - ▶ There are some new .deb files in the parent directory
- 6 Lihat pada direktori debian/

# Outline

# Paket source

- ▶ One source package can generate several binary packages  
e.g. the `libtar` source generates the `libtar0` and `libtar-dev` binary packages
- ▶ Two kinds of packages: (if unsure, use non-native)
  - ▶ Native packages: normally for Debian specific software (*dpkg*, *apt*)
  - ▶ Non-native packages: software developed outside Debian
- ▶ Main file: `.dsc` (meta-data)
- ▶ Other files depending on the version of the source format
  - ▶ 1.0 or 3.0 (native): `package_version.tar.gz`
  - ▶ 1.0 (non-native):
    - ▶ `pkg_ver.orig.tar.gz`: upstream source
    - ▶ `pkg_debver.diff.gz`: patch to add Debian-specific changes
  - ▶ 3.0 (quilt):
    - ▶ `pkg_ver.orig.tar.gz`: upstream source
    - ▶ `pkg_debver.debian.tar.gz`: tarball with the Debian changes

(See `dpkg-source(1)` for exact details)

# Contoh paket source (wget\_1.12-2.1.dsc)

```
Format: 3.0 (quilt)
Source: wget
Binary: wget
Architecture: any
Version: 1.12-2.1
Maintainer: Noel Kothé <noel@debian.org>
Homepage: http://www.gnu.org/software/wget/
Standards-Version: 3.8.4
Build-Depends: debhelper (>> 5.0.0), gettext, texinfo,
    libssl-dev (>= 0.9.8), dpatch, info2man
Checksums-Sha1:
    50d4ed2441e67[..]1ee0e94248 2464747 wget_1.12.orig.tar.gz
    d4c1c8bbe431d[..]dd7cef3611 48308 wget_1.12-2.1.debian.tar.gz
Checksums-Sha256:
    7578ed0974e12[..]dcba65b572 2464747 wget_1.12.orig.tar.gz
    1e9b0c4c00eae[..]89c402ad78 48308 wget_1.12-2.1.debian.tar.gz
Files:
    141461b9c04e4[..]9d1f2abf83 2464747 wget_1.12.orig.tar.gz
    e93123c934e3c[..]2f380278c2 48308 wget_1.12-2.1.debian.tar.gz
```

# Retrieving an existing source package

- ▶ Dari arsip Debian:
  - ▶ `apt-get source package`
  - ▶ `apt-get source package=version`
  - ▶ `apt-get source package/release`(Anda memerlukan baris `deb-src` di `sources.list`)
- ▶ Dari Internet:
  - ▶ `dget url-to.dsc`
  - ▶ `dget http://snapshot.debian.org/archive/debian-archive/20090802T004153Z/debian/dists/bo/main/source/web/wget_1.4.4-6.dsc`  
(`snapshot.d.o` menyediakan semua paket dari Debian sejak 2005)
- ▶ Dari sistem pengontrol versi:
  - ▶ `debcheckout package`
- ▶ Setelah diunduh, bongkar dengan `dpkg-source -x file.dsc`

# Membuat sebuah dasar paket source

- ▶ Download the upstream source  
(*upstream source* = the one from the software's original developers)
- ▶ Rename to `<source_package>_<upstream_version>.orig.tar.gz`  
(example: `simgrid_3.6.orig.tar.gz`)
- ▶ Untar it
- ▶ Rename the directory to `<source_package>-<upstream_version>`  
(example: `simgrid-3.6`)
- ▶ `cd <source_package>-<upstream_version> && dh_make`  
(from the **dh-make** package)
- ▶ There are some alternatives to `dh_make` for specific sets of packages:  
**dh-make-perl**, **dh-make-php**, ...
- ▶ `debian/` directory created, with a lot of files in it

## Berkas di debian/

All the packaging work should be made by modifying files in `debian/`

- ▶ Main files:
  - ▶ **control** – meta-data about the package (dependencies, etc.)
  - ▶ **rules** – specifies how to build the package
  - ▶ **copyright** – informasi lisensi untuk paket
  - ▶ **changelog** – catatan dari paket Debian
- ▶ Berkas-berkas lainnya:
  - ▶ `compat`
  - ▶ `watch`
  - ▶ `dh_install*` targets  
    `*.dirs`, `*.docs`, `*.manpages`, ...
  - ▶ maintainer scripts  
    `*.postinst`, `*.prerm`, ...
  - ▶ `source/format`
  - ▶ `patches/` – if you need to modify the upstream sources
- ▶ Several files use a format based on RFC 822 (mail headers)

# debian/changelog

- ▶ Lists the Debian packaging changes
- ▶ Gives the current version of the package

1.2.1.1-5  
Upstream Debian  
version revision

- ▶ Sunting secara manual atau dengan **dch**
  - ▶ Membuat sebuah entri changelog untuk rilis baru: **dch -i**
- ▶ Special format to automatically close Debian or Ubuntu bugs  
Debian: Closes: #595268; Ubuntu: LP: #616929
- ▶ Terpasang sebagai `/usr/share/doc/package/changelog.Debian.gz`

---

```
mpich2 (1.2.1.1-5) unstable; urgency=low
```

- \* Use `/usr/bin/python` instead of `/usr/bin/python2.5`. Allow to drop dependency on `python2.5`. Closes: #595268
- \* Make `/usr/bin/mpdroot` `setuid`. This is the default after the installation of `mpich2` from source, too. LP: #616929
- + Add corresponding lintian override.

```
-- Lucas Nussbaum <lucas@debian.org> Wed, 15 Sep 2010 18:13:44 +0200
```

# debian/control

- ▶ Package metadata
  - ▶ For the source package itself
  - ▶ For each binary package built from this source
- ▶ Package name, section, priority, maintainer, uploaders, build-dependencies, dependencies, description, homepage, ...
- ▶ Dokumentasi: Debian Policy bagian 5  
<https://www.debian.org/doc/debian-policy/ch-controlfields>

---

```
Source: wget
Section: web
Priority: important
Maintainer: Noel Kothe <noel@debian.org>
Build-Depends: debhelper (> 5.0.0), gettext, texinfo,
  libssl-dev (>= 0.9.8), dpatch, info2man
Standards-Version: 3.8.4
Homepage: http://www.gnu.org/software/wget/
```

```
Package: wget
Architecture: any
Depends: ${shlibs:Depends}, ${misc:Depends}
Description: retrieves files from the web
  Wget is a network utility to retrieve files from the Web
```

# Architecture: all atau any

Two kinds of binary packages:

- ▶ Packages with different contents on each Debian architecture
  - ▶ Contoh: program C
  - ▶ Architecture: any di `debian/control`
    - ▶ Or, if it only works on a subset of architectures:  
Architecture: amd64 i386 ia64 hurd-i386
  - ▶ `buildd.debian.org`: builds all the other architectures for you on upload
  - ▶ Bernama `package_version_architecture.deb`
- ▶ Packages with the same content on all architectures
  - ▶ Contoh: librari Perl
  - ▶ Architecture: all di `debian/control`
  - ▶ Bernama `package_version_all.deb`

A source package can generate a mix of Architecture: any and Architecture: all binary packages

# debian/rules

- ▶ Makefile
- ▶ Interface used to build Debian packages
- ▶ Di dokumentasikan di Debian Policy, bagian 4.8  
<https://www.debian.org/doc/debian-policy/ch-source#s-debianrules>
- ▶ Required targets:
  - ▶ build, build-arch, build-indep: should perform all the configuration and compilation
  - ▶ binary, binary-arch, binary-indep: membangun paket binari
    - ▶ dpkg-buildpackage will call binary to build all the packages, or binary-arch to build only the Architecture: any packages
  - ▶ clean: membersihkan direktori source

# Packaging helpers – debhelper

- ▶ You could write shell code in `debian/rules` directly
  - ▶ Lihat paket `adduser` sebagai contoh
- ▶ Better practice (used by most packages): use a *Packaging helper*
- ▶ Most popular one: **debhelper** (used by 98% of packages)
- ▶ Tujuan:
  - ▶ Factor the common tasks in standard tools used by all packages
  - ▶ Fix some packaging bugs once for all packages

`dh_installdirs`, `dh_installchangelogs`, `dh_installdocs`, `dh_installexamples`, `dh_install`,  
`dh_installdebconf`, `dh_installinit`, `dh_link`, `dh_strip`, `dh_compress`, `dh_fixperms`, `dh_perl`,  
`dh_makeshlibs`, `dh_installdeb`, `dh_shlibdeps`, `dh_gencontrol`, `dh_md5sums`, `dh_builddeb`, ...

- ▶ Dipanggil dari `debian/rules`
  - ▶ Configurable using command parameters or files in `debian/`  
`package.docs`, `package.examples`, `package.install`, `package.manpages`, ...
- ▶ Third-party helpers for sets of packages: **python-support**, **dh\_ocaml**, ...
- ▶ Gotcha: `debian/compat`: Debhelper compatibility version (use "7")

# debian/rules menggunakan debhelper (1/2)

```
#!/usr/bin/make -f

# Uncomment this to turn on verbose mode.
#export DH_VERBOSE=1

build:
    $(MAKE)
    #docbook-to-man debian/packageName.sgml > packageName.1

clean:
    dh_testdir
    dh_testroot
    rm -f build-stamp configure-stamp
    $(MAKE) clean
    dh_clean

install: build
    dh_testdir
    dh_testroot
    dh_clean -k
    dh_installdirs
    # Add here commands to install the package into debian/package
    $(MAKE) DESTDIR=$(CURDIR)/debian/packageName install
```

## debian/rules menggunakan debhelper (2/2)

```
# Build architecture-independent files here.
```

```
binary-indep: build install
```

```
# Build architecture-dependent files here.
```

```
binary-arch: build install
```

```
dh_testdir
```

```
dh_testroot
```

```
dh_installchangelogs
```

```
dh_installdocs
```

```
dh_installexamples
```

```
dh_install
```

```
dh_installman
```

```
dh_link
```

```
dh_strip
```

```
dh_compress
```

```
dh_fixperms
```

```
dh_installdeb
```

```
dh_shlibdeps
```

```
dh_gencontrol
```

```
dh_md5sums
```

```
dh_builddeb
```

```
binary: binary-indep binary-arch
```

```
.PHONY: build clean binary-indep binary-arch binary install configure
```

# CDBS

- ▶ With debhelper, still a lot of redundancy between packages
- ▶ Second-level helpers that factor common functionality
  - ▶ E.g. building with `./configure && make && make install` or CMake
- ▶ CDBS:
  - ▶ Introduced in 2005, based on advanced *GNU make* magic
  - ▶ Dokumentasi: `/usr/share/doc/cdb/`
  - ▶ Dukungan untuk Perl, Python, Ruby, GNOME, KDE, Java, Haskell, ...
  - ▶ Namun sebagian orang membenci ini:
    - ▶ Sometimes difficult to customize package builds:  
*"twisty maze of makefiles and environment variables"*
    - ▶ Slower than plain debhelper (many useless calls to `dh_*`)

---

```
#!/usr/bin/make -f
include /usr/share/cdb/1/rules/debhelper.mk
include /usr/share/cdb/1/class/autotools.mk
```

```
# add an action after the build
build/mypackage::
    /bin/bash debian/scripts/foo.sh
```

# Dh (alias Debhelper 7, atau dh7)

- ▶ Introduced in 2008 as a *CDBS* killer
- ▶ **dh** command that calls `dh_*`
- ▶ Simple *debian/rules*, listing only overrides
- ▶ Easier to customize than CDBS
- ▶ Doc: manpages (`debhelper(7)`, `dh(1)`) + slides from DebConf9 talk  
<http://kitenet.net/~joey/talks/debhelper/debhelper-slides.pdf>

---

```
#!/usr/bin/make -f
%:
    dh $@

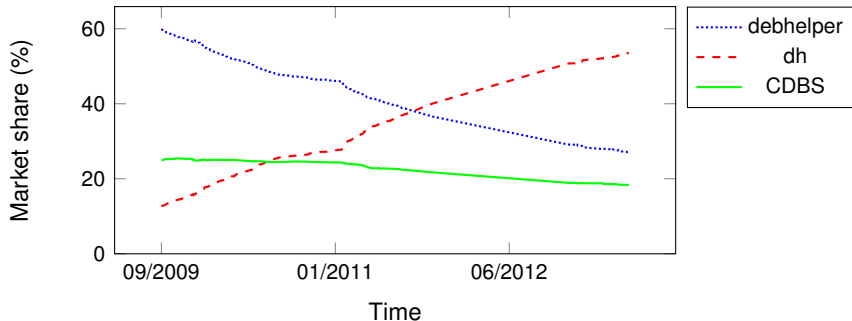

override_dh_auto_configure:
    dh_auto_configure -- --with-kitchen-sink

override_dh_auto_build:
    make world
```

# Classic debhelper vs CDBS vs dh

- ▶ Mind shares:  
Classic debhelper: 27%   CDBS: 18%   dh: 54%
- ▶ Which one should I learn?
  - ▶ Probably a bit of all of them
  - ▶ You need to know debhelper to use dh and CDBS
  - ▶ You might have to modify CDBS packages
- ▶ Which one should I use for a new package?
  - ▶ **dh** (only solution with an increasing mind share)

# Outline

# Membangun paket

- ▶ `apt-get build-dep mypackage`  
Installs the *build-dependencies* (for a package already in Debian)  
Or `mk-build-deps -ir` (for a package not uploaded yet)
- ▶ `debuild`: bangun, uji dengan lintian, tandatangani dengan GPG
- ▶ Also possible to call `dpkg-buildpackage` directly
  - ▶ Usually with `dpkg-buildpackage -us -uc`
- ▶ It is better to build packages in a clean & minimal environment
  - ▶ `pbuilder` – bantuan untuk membangun paket di sebuah *chroot*  
Dokumentasi yang baik: <https://wiki.ubuntu.com/PbuilderHowto>  
(optimization: `cowbuilder ccache distcc`)
  - ▶ `schroot` and `sbuid`: used on the Debian build daemons  
(not as simple as pbuilder, but allows LVM snapshots  
see: <https://help.ubuntu.com/community/SbuildLVMHowto> )
- ▶ Membuat berkas `.deb` dan sebuah berkas `.changes`
  - ▶ `.changes`: describes what was built; used to upload the package

# Memasang dan menguji paket

- ▶ Install the package locally: `debi` (will use `.changes` to know what to install)
- ▶ List the content of the package: `debc` `../mypackage<TAB>.changes`
- ▶ Membandingkan paket dengan versi sebelumnya:  
`debdiff` `../mypackage_1_*.changes` `../mypackage_2_*.changes`  
atau untuk membandingkan sources:  
`debdiff` `../mypackage_1_*.dsc` `../mypackage_2_*.dsc`
- ▶ Memeriksa paket dengan lintian (static analyzer):  
`lintian` `../mypackage<TAB>.changes`  
`lintian -i`: memberikan informasi lainnya tentang galat  
`lintian -EviIL +pedantic`: menampilkan masalah lainnya
- ▶ Mengunggah paket ke Debian (`dput`) (memerlukan konfigurasi)
- ▶ Membuat sebuah arsip pribadi Debian dengan `reprepro` atau `aptly`  
Dokumentasi:  
<https://wiki.debian.org/HowToSetupADebianRepository>

# Outline

# Praktek sesi 1: memodifikasi paket grep

- ➊ Pergi ke `http://ftp.debian.org/debian/pool/main/g/grep/` dan unduh versi 2.12-2 dari paket
  - ▶ Apabila paket source tidak dibongkar secara otomatis, bongkar dengan `dpkg-source -x grep_*.dsc`
- ➋ Lihat berkas-berkas di `debian/`.
  - ▶ Berapa banyak paket binari yang dibuat dari paket source?
  - ▶ Which packaging helper does this package use?
- ➌ Membangun paket
- ➍ Sekarang kita menuju ke memodifikasi paket. Buat sebuah entri changelog dan tambahkan nomor versi.
- ➎ Now disable perl-regexp support (it is a `./configure` option)
- ➏ Membangun kembali paket
- ➐ Bandingkan paket asli dan paket baru dengan `debdiff`
- ➑ Pasang paket baru yang telah dibuat
- ➒ Cry if you messed up ;)

# Outline

# debian/copyright

- ▶ Informasi hak cipta dan lisensi untuk paket source dan paket
- ▶ Secara tradisional ditulis sebagai berkas text
- ▶ New machine-readable format:

<https://www.debian.org/doc/packaging-manuals/copyright-format/1.0/>

---

```
Format: https://www.debian.org/doc/packaging-manuals/copyright-format/1.0/

# Memodifikasi paket upstream

Often needed:

- ▶ Perbaiki kutu atau menambahkan kostumisasi secara spesifik ke Debian
- ▶ Perbaiki Backport dari sebuah rilis upstream terbaru

Several methods to do it:

- ▶ Modifying the files directly
  - ▶ Ringkas
  - ▶ But no way to track and document the changes
- ▶ Menggunakan sistem penambalan
  - ▶ Eases contributing your changes to upstream
  - ▶ Helps sharing the fixes with derivatives
  - ▶ Gives more exposure to the changes

<http://patch-tracker.debian.org/> (down currently)

# Menambal sistem

- ▶ Principle: changes are stored as patches in `debian/patches/`
- ▶ Applied and unapplied during build
- ▶ Past: several implementations – *simple-patchsys* (*cdb*s), *dpatch*, **quilt**
  - ▶ Each supports two `debian/rules` targets:
    - ▶ `debian/rules patch`: apply all patches
    - ▶ `debian/rules unpatch`: de-apply all patches
  - ▶ Dokumentasi lainnya: <https://wiki.debian.org/debian/patches>
- ▶ **New source package format with built-in patch system: 3.0 (quilt)**
  - ▶ Solusi yang direkomendasikan
  - ▶ Anda perlu mempelajari *quilt*  
<http://pkg-perl.alioth.debian.org/howto/quilt.html>
  - ▶ Perangkat patch-system-agnostic di `devscripts`: `edit-patch`

# Dokumentasi dari penambalan

- ▶ Standard headers at the beginning of the patch
- ▶ Documented in DEP-3 - Patch Tagging Guidelines  
<http://dep.debian.net/deps/dep3/>

---

```
Description: Fix widget frobnication speeds
 Frobnicating widgets too quickly tended to cause explosions.
Forwarded: http://lists.example.com/2010/03/1234.html

# Doing things during installation and removal

- ▶ Decompressing the package is sometimes not enough
- ▶ Create/remove system users, start/stop services, manage *alternatives*
- ▶ Selesai di *maintainer scripts*  
preinst, postinst, prerm, postrm
  - ▶ Snippets for common actions can be generated by debhelper
- ▶ Dokumentasi:
  - ▶ Panduan Debian Policy, bagian 6  
<https://www.debian.org/doc/debian-policy/ch-maintainerscripts>
  - ▶ Debian Developer's Reference, bagian 6.4  
<https://www.debian.org/doc/developers-reference/best-pkging-practices.html>
  - ▶ <https://people.debian.org/~srivasta/MaintainerScripts.html>
- ▶ Prompting the user
  - ▶ Must be done with **debconf**
  - ▶ Dokumentasi: debconf-devel(7) (paket debconf-doc)

# Memantau versi upstream

- ▶ Lihat secara spesifik di `debian/watch` (lihat `uscan(1)`)

```
version=3
```

```
http://tmrc.mit.edu/mirror/twisted/Twisted/(\d\.\d)/ \
Twisted-([\d\.]*)\.tar\.bz2
```

- ▶ Ini secara otomatis akan memeriksa paket upstream terakhir, that notify the maintainer on various dashboards including <https://tracker.debian.org/> dan <https://udd.debian.org/dmd/>
- ▶ `uscan`: jalankan pengecekan manual
- ▶ `uupdate`: coba untuk memperbaharui paket Anda ke versi upstream terakhir

# Pemaketan dengan Version Control System

- ▶ Several tools to help manage branches and tags for your packaging work:  
svn-buildpackage, git-buildpackage
- ▶ Contoh: git-buildpackage
  - ▶ upstream branch to track upstream with upstream/version tags
  - ▶ master branch tracks the Debian package
  - ▶ debian/version tags for each upload
  - ▶ pristine-tar branch to be able to rebuild the upstream tarball

Doc: <http://honk.sigxcpu.org/projects/git-buildpackage/manual-html/gbp.html>

- ▶ Vcs-\* fields in debian/control to locate the repository
  - ▶ <https://wiki.debian.org/Alioth/Git>
  - ▶ <https://wiki.debian.org/Alioth/Svn>

Vcs-Browser: <http://anonscm.debian.org/gitweb/?p=collab-maint/devscripts.git>

Vcs-Git: [git://anonscm.debian.org/collab-maint/devscripts.git](http://anonscm.debian.org/collab-maint/devscripts.git)

Vcs-Browser: <http://svn.debian.org/viewsvn/pkg-perl/trunk/libwww-perl/>

Vcs-Svn: [svn://svn.debian.org/pkg-perl/trunk/libwww-perl](http://svn.debian.org/viewsvn/pkg-perl/trunk/libwww-perl/)

- ▶ VCS-agnostic interface: debcheckout, debcommit, debrelease
  - ▶ debcheckout grep → checks out the source package from Git

# Backporting packages

- ▶ Goal: use a newer version of a package on an older system  
e.g. use *mutt* from Debian *unstable* on Debian *stable*
- ▶ General idea:
  - ▶ Take the source package from Debian unstable
  - ▶ Modify it so that it builds and works fine on Debian stable
    - ▶ Sometimes trivial (no changes needed)
    - ▶ Sometimes difficult
    - ▶ Sometimes impossible (many unavailable dependencies)
- ▶ Some backports are provided and supported by the Debian project  
<http://backports.debian.org/>

# Outline

# Several ways to contribute to Debian

---

► **Worst** way to contribute:

- ❶ Package your own application
- ❷ Get it into Debian
- ❸ Disappear

► **Better** ways to contribute:

- Get involved in packaging teams
  - Many teams that focus on set of packages, and need help
  - List available at <https://wiki.debian.org/Teams>
  - An excellent way to learn from more experienced contributors
- Adopt existing unmaintained packages (*orphaned packages*)
- Bring new software to Debian
  - Only if it's interesting/useful enough, please
  - Are there alternatives already packaged in Debian?

# Adopting orphaned packages

- ▶ Many unmaintained packages in Debian
- ▶ Full list + process: <https://www.debian.org/devel/wnpp/>
- ▶ Installed on your machine: `wnpp-alert`
- ▶ Different states:
  - ▶ **O**rphaned: the package is unmaintained  
Feel free to adopt it
  - ▶ **RFA**: **R**equ<sup>st</sup> **F**or **A**dopter  
Maintainer looking for adopter, but continues work in the meantime  
Feel free to adopt it. A mail to the current maintainer is polite
  - ▶ **ITA**: **I**ntent **T**o **A**dopt  
Someone intends to adopt the package  
You could propose your help!
  - ▶ **RFH**: **R**equ<sup>st</sup> **F**or **H**elp  
The maintainer is looking for help
- ▶ Some unmaintained packages not detected → not orphaned yet
- ▶ When in doubt, ask `debian-qa@lists.debian.org`  
or `#debian-qa` on `irc.debian.org`

# Adopting a package: example

```
From: You <you@yourdomain>  
To: 640454@bugs.debian.org, control@bugs.debian.org  
Cc: Francois Marier <francois@debian.org>  
Subject: ITA: verbiste -- French conjugator
```

```
retitle 640454 ITA: verbiste -- French conjugator  
owner 640454 !  
thanks
```

Hi,

I am using verbiste and I am willing to take care of the package.

Cheers,

You

- ▶ Polite to contact the previous maintainer (especially if the package was RFAed, not orphaned)
- ▶ Very good idea to contact the upstream project

# Getting your package in Debian

- ▶ You do not need any official status to get your package into Debian
  - ➊ Submit an **ITP** bug (Intend To Package) using `reportbug wnpp`
  - ➋ Prepare a source package
  - ➌ Find a Debian Developer that will sponsor your package
- ▶ Official status (when you are an experienced package maintainer):
  - ▶ **Debian Maintainer (DM):**  
Permission to upload your own packages  
See <https://wiki.debian.org/DebianMaintainer>
  - ▶ **Debian Developer (DD):**  
Debian project member; can vote and upload any package

# Things to check before asking for sponsorship

---

- ▶ Debian puts **a lot of focus on quality**
- ▶ Generally, **sponsors are hard to find and busy**
  - ▶ Make sure your package is ready before asking for sponsorship
- ▶ Things to check:
  - ▶ Avoid missing build-dependencies: make sure that your package build fine in a clean *sid chroot*
    - ▶ Using `pbuilder` is recommended
  - ▶ Run `lintian -EviIL +pedantic` on your package
    - ▶ Errors must be fixed, all other problems should be fixed
  - ▶ Do extensive testing of your package, of course
- ▶ In doubt, ask for help

# Where to find help?

Help you will need:

- ▶ Advice and answers to your questions, code reviews
- ▶ Sponsorship for your uploads, once your package is ready

You can get help from:

- ▶ **Other members of a packaging team**
  - ▶ List of teams: <https://wiki.debian.org/Teams>
- ▶ The **Debian Mentors group** (if your package does not fit in a team)
  - ▶ <https://wiki.debian.org/DebianMentorsFaq>
  - ▶ Mailing list: [debian-mentors@lists.debian.org](mailto:debian-mentors@lists.debian.org)  
(also a good way to learn by accident)
  - ▶ IRC: #debian-mentors on [irc.debian.org](http://irc.debian.org)
  - ▶ <http://mentors.debian.net/>
  - ▶ Documentation: <http://mentors.debian.net/intro-maintainers>
- ▶ **Localized mailing lists** (get help in your language)
  - ▶ [debian-devel-{french,italian,portuguese,spanish}@lists.d.o](mailto:debian-devel-{french,italian,portuguese,spanish}@lists.d.o)
  - ▶ Full list: <https://lists.debian.org/devel.html>
  - ▶ Or users lists: <https://lists.debian.org/users.html>

# Dokumentasi lainnya

# Using the Debian Bug Tracking System (BTS)

- ▶ A quite unique way to manage bugs
  - ▶ Web interface to view bugs
  - ▶ Email interface to make changes to bugs
- ▶ Adding information to bugs:
  - ▶ Write to `123456@bugs.debian.org` (does not include the submitter, you need to add `123456-submitter@bugs.debian.org`)
- ▶ Changing bug status:
  - ▶ Send commands to `control@bugs.debian.org`
  - ▶ Command-line interface: `bts` command in `devscripts`
  - ▶ Documentation: <https://www.debian.org/Bugs/server-control>
- ▶ Reporting bugs: use `reportbug`
  - ▶ Normally used with a local mail server: install `ssmtp` or `nullmailer`
  - ▶ Or use `reportbug --template`, then send (manually) to `submit@bugs.debian.org`

# Using the BTS: examples

- ▶ Sending an email to the bug and the submitter:  
`https://bugs.debian.org/cgi-bin/bugreport.cgi?bug=680822#10`
- ▶ Tagging and changing the severity:  
`https://bugs.debian.org/cgi-bin/bugreport.cgi?bug=680227#10`
- ▶ Reassigning, changing the severity, retitling ...:  
`https://bugs.debian.org/cgi-bin/bugreport.cgi?bug=680822#93`
  - ▶ notfound, found, notfixed, fixed are for **version-tracking**  
See `https://wiki.debian.org/HowtoUseBTS#Version\_tracking`
- ▶ Using usertags: `https://bugs.debian.org/cgi-bin/bugreport.cgi?msg=42;bug=642267`  
See `https://wiki.debian.org/bugs.debian.org/usertags`
- ▶ BTS Documentation:
  - ▶ `https://www.debian.org/Bugs/`
  - ▶ `https://wiki.debian.org/HowtoUseBTS`

# More interested in Ubuntu?

- ▶ Ubuntu mainly manages the divergence with Debian
- ▶ No real focus on specific packages  
Instead, collaboration with Debian teams
- ▶ Usually recommend uploading new packages to Debian first  
<https://wiki.ubuntu.com/UbuntuDevelopment/NewPackages>
- ▶ Possibly a better plan:
  - ▶ Get involved in a Debian team and act as a bridge with Ubuntu
  - ▶ Help reduce divergence, triage bugs in Launchpad
  - ▶ Many Debian tools can help:
    - ▶ Ubuntu column on the Developer's packages overview
    - ▶ Ubuntu box on the Package Tracking System
    - ▶ Receive launchpad bugmail via the PTS

# Outline

# Kesimpulan

- ▶ You now have a full overview of Debian packaging
- ▶ But you will need to read more documentation
- ▶ Best practices have evolved over the years
  - ▶ If not sure, use the **dh** packaging helper, and the **3.0 (quilt)** format
- ▶ Things that were not covered in this tutorial:
  - ▶ UCF – manage user changes to configuration files when upgrading
  - ▶ dpkg triggers – group similar maintainer scripts actions together
  - ▶ Debian development organization:
    - ▶ Suites: stable, testing, unstable, experimental, security, \*-updates, backports, . . .
    - ▶ Debian Blends – subsets of Debian targeting specific groups

Feedback: **[packaging-tutorial@packages.debian.org](mailto:packaging-tutorial@packages.debian.org)**

# Outline

# Praktek sesi 2: memaketkan GNUjump

- 1 Download GNUjump 1.0.8 from  
<http://ftp.gnu.org/gnu/gnujump/gnujump-1.0.8.tar.gz>
- 2 Create a Debian package for it
  - ▶ Install build-dependencies so that you can build the package
  - ▶ Get a basic working package
  - ▶ Finish filling `debian/control` and other files
- 3 Enjoy

# Praktek sesi 3: memaketkan librari Java

## 1 Take a quick look at some documentation about Java packaging:

- ▶ <https://wiki.debian.org/Java>
- ▶ <https://wiki.debian.org/Java/Packaging>
- ▶ <https://www.debian.org/doc/packaging-manuals/java-policy/>
- ▶ <http://pkg-java.alioth.debian.org/docs/tutorial.html>
- ▶ Paper and slides from a Debconf10 talk about javahelper:  
<http://pkg-java.alioth.debian.org/docs/debconf10-javahelper-paper.pdf>  
<http://pkg-java.alioth.debian.org/docs/debconf10-javahelper-slides.pdf>

## 2 Download IRClib from <http://moepii.sourceforge.net/>

## 3 Package it

# Praktek sesi 4: memaketkan Ruby gem

- 1 Take a quick look at some documentation about Ruby packaging:
  - ▶ <https://wiki.debian.org/Ruby>
  - ▶ <https://wiki.debian.org/Teams/Ruby>
  - ▶ <https://wiki.debian.org/Teams/Ruby/Packaging>
  - ▶ `gem2deb(1)`, `dh_ruby(1)` (in the `gem2deb` package)
- 2 Create a basic Debian source package from the `peach` gem:  
`gem2deb peach`
- 3 Improve it so that it becomes a proper Debian package

# Praktek sesi 5: memaketkan modul Perl

- 1 Take a quick look at some documentation about Perl packaging:
  - ▶ <http://pkg-perl.alioth.debian.org/>
  - ▶ <https://wiki.debian.org/Teams/DebianPerlGroup>
  - ▶ `dh-make-perl(1)`, `dpt(1)` (in the `pkg-perl-tools` package)
- 2 Create a basic Debian source package from the `Acme` CPAN distribution:  
`dh-make-perl --cpan Acme`
- 3 Improve it so that it becomes a proper Debian package

# Outline

# Answers to sesi praktek

# Praktek sesi 1: memodifikasi paket grep

- ➊ Pergi ke `http://ftp.debian.org/debian/pool/main/g/grep/` dan unduh versi 2.12-2 dari paket
- ➋ Lihat berkas-berkas di `debian/`.
  - ▶ Berapa banyak paket binari yang dibuat dari paket source?
  - ▶ Which packaging helper does this package use?
- ➌ Membangun paket
- ➍ Sekarang kita menuju ke memodifikasi paket. Buat sebuah entri changelog dan tambahkan nomor versi.
- ➎ Now disable perl-regexp support (it is a `./configure` option)
- ➏ Membangun kembali paket
- ➐ Bandingkan paket asli dan paket baru dengan `debdiff`
- ➑ Pasang paket baru yang telah dibuat
- ➒ Cry if you messed up ;)

# Fetching the source

- ➊ Go to `http://ftp.debian.org/debian/pool/main/g/grep/` and download version 2.6.3-3 of the package
- ▶ Use `dget` to download the `.dsc` file:  
`dget http://cdn.debian.net/debian/pool/main/g/grep/grep_2.6.3-3.dsc`
- ▶ According to `https://tracker.debian.org/grep`, `grep` version 2.12-2 is currently in *stable* (*wheezy*). If you have `deb-src` lines for *squeeze* in your `/etc/apt/sources.list`, you can use:  
`apt-get source grep=2.12-2`  
or `apt-get source grep/stable`  
or, if you feel lucky: `apt-get source grep`
- ▶ The `grep` source package is composed of three files:
  - ▶ `grep_2.6.3-3.dsc`
  - ▶ `grep_2.6.3-3.debian.tar.bz2`
  - ▶ `grep_2.6.3.orig.tar.bz2`This is typical of the "3.0 (quilt)" format.
- ▶ If needed, uncompress the source with  
`dpkg-source -x grep_2.6.3-3.dsc`

# Looking around and building the package

## ② Lihat berkas-berkas di `debian/`.

- ▶ Berapa banyak paket binari yang dibuat dari paket source?
- ▶ Which packaging helper does this package use?
- ▶ According to `debian/control`, this package only generates one binary package, named `grep`.
- ▶ According to `debian/rules`, this package is typical of *classic* debhelper packaging, without using *CDBS* or *dh*. One can see the various calls to `dh_*` commands in `debian/rules`.

## ③ Membangun paket

- ▶ Use `apt-get build-dep grep` to fetch the build-dependencies
- ▶ Then `debuild` or `dpkg-buildpackage -us -uc` (Takes about 1 min)

# Editing the changelog

- ④ Sekarang kita menuju ke memodifikasi paket. Buat sebuah entri changelog dan tambahkan nomor versi.
- ▶ `debian/changelog` is a text file. You could edit it and add a new entry manually.
- ▶ Or you can use `dch -i`, which will add an entry and open the editor
- ▶ The name and email can be defined using the `DEBFULLNAME` and `DEBEMAIL` environment variables
- ▶ After that, rebuild the package: a new version of the package is built
- ▶ Package versioning is detailed in section 5.6.12 of the Debian policy <https://www.debian.org/doc/debian-policy/ch-controlfields>

# Disabling Perl regexp support and rebuilding

- 5 Now disable perl-regexp support (it is a `./configure` option)
- 6 Membangun kembali paket
  - ▶ Check with `./configure --help`: the option to disable Perl regexp is `--disable-perl-regexp`
  - ▶ Edit `debian/rules` and find the `./configure` line
  - ▶ Add `--disable-perl-regexp`
  - ▶ Rebuild with `debuild` or `dpkg-buildpackage -us -uc`

# Comparing and testing the packages

- 7 Bandingkan paket asli dan paket baru dengan debdiff
- 8 Pasang paket baru yang telah dibuat
  - ▶ Compare the binary packages: `debdiff ../changes`
  - ▶ Compare the source packages: `debdiff ../dsc`
  - ▶ Install the newly built package: `debi`  
Or `dpkg -i ../grep_<TAB>`
  - ▶ `grep -P foo` no longer works!
- 9 Cry if you messed up ;)

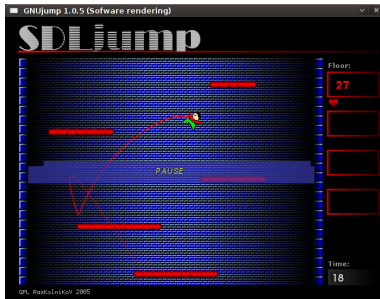

Or not: reinstall the previous version of the package:

- ▶ `apt-get install --reinstall grep=2.6.3-3 (= previous version)`

# Praktek sesi 2: memaketkan GNUjump

- 1 Download GNUjump 1.0.8 from  
<http://ftp.gnu.org/gnu/gnujump/gnujump-1.0.8.tar.gz>
- 2 Create a Debian package for it
  - ▶ Install build-dependencies so that you can build the package
  - ▶ Get a basic working package
  - ▶ Finish filling `debian/control` and other files
- 3 Enjoy

## Step by step...

- ▶ `wget http://ftp.gnu.org/gnu/gnujump/gnujump-1.0.8.tar.gz`
- ▶ `mv gnujump-1.0.8.tar.gz gnujump_1.0.8.orig.tar.gz`
- ▶ `tar xf gnujump_1.0.8.orig.tar.gz`
- ▶ `cd gnujump-1.0.8/`
- ▶ `dh_make`
  - ▶ Type of package: single binary (for now)

```
gnujump-1.0.8$ ls debian/
changelog          gnujump.default.ex  preinst.ex
compat            gnujump.doc-base.EX prerm.ex
control           init.d.ex           README.Debian
copyright         manpage.1.ex       README.source
docs              manpage.sgml.ex    rules
emacsen-install.ex manpage.xml.ex      source
emacsen-remove.ex  menu.ex            watch.ex
emacsen-startup.ex postinst.ex
gnujump.cron.d.ex  postrm.ex
```

## Step by step... (2)

- ▶ Look at `debian/changelog`, `debian/rules`, `debian/control` (auto-filled by **dh\_make**)
- ▶ In `debian/control`:  
Build-Depends: `debhelper (>= 7.0.50 )`, `autotools-dev`  
Lists the *build-dependencies* = packages needed to build the package
- ▶ Try to build the package as-is (thanks to **dh** magic)
  - ▶ And add build-dependencies, until it builds
  - ▶ Hint: use `apt-cache search` and `apt-file` to find the packages
  - ▶ Contoh:

```
checking for sdl-config... no
checking for SDL - version >= 1.2.0... no
[...]
configure: error: *** SDL version 1.2.0 not found!
```

→ Add **libsdl1.2-dev** to Build-Depends and install it.

- ▶ Better: use **pbuilder** to build in a clean environment

## Step by step... (3)

- ▶ After installing `libSDL1.2-dev`, `libSDL-image1.2-dev`, `libSDL-mixer1.2-dev`, you probably run into another error:

```
/usr/bin/ld: SDL_rotozoom.o: undefined reference to symbol 'ceil@@GLIBC_2.2.5'  
//lib/x86_64-linux-gnu/libm.so.6: error adding symbols: DSO missing from command  
collect2: error: ld returned 1 exit status  
Makefile:376: recipe for target 'gnujump' failed
```

- ▶ This problem is caused by bitrot: `gnujump` has not been adjusted following linker changes. It requires a patch in the Debian package, which can be created with the following commands:

- ▶ `mkdir debian/patches`  
`quilt new linker-fixes.patch`  
`quilt add src/Makefile.am`
- ▶ Edit `src/Makefile.am` and replace  
`gnujump_LDFLAGS = $(all_libraries)`  
by  
`gnujump_LDFLAGS = -Wl,--as-needed`  
`gnujump_LDADD = $(all_libraries) -lm`
- ▶ `quilt refresh`

## Step by step... (4)

- ▶ Since `src/Makefile.am` was changed, `autoreconf` must be called during the build. To do that automatically with `dh`, change the `dh` call in `debian/rules` from: `dh $ --with autotools-dev`  
to: `dh $ --with autotools-dev --with autoreconf`
- ▶ Use `debc` to list the content of the generated package, and `debi` to install it and test it.
- ▶ Test the package with `lintian`
  - ▶ While not a strict requirement, it is recommended that packages uploaded to Debian are *lintian-clean*
  - ▶ More problems can be listed using `lintian -EviIL +pedantic`
  - ▶ Some hints:
    - ▶ Remove the files that you don't need in `debian/`
    - ▶ Fill in `debian/control`
    - ▶ Install the executable to `/usr/games` by overriding `dh_auto_configure`
    - ▶ Use *hardening* compiler flags to increase security.  
See <https://wiki.debian.org/Hardening>

## Step by step... (4)

- ▶ Compare your package with the one already packaged in Debian:
  - ▶ It splits the data files to a second package, that is the same across all architectures (→ saves space in the Debian archive)
  - ▶ It installs a .desktop file (for the GNOME/KDE menus) and also integrates into the Debian menu
  - ▶ It fixes a few minor problems using patches

# Praktek sesi 3: memaketkan librari Java

## ❶ Take a quick look at some documentation about Java packaging:

- ▶ <https://wiki.debian.org/Java>
- ▶ <https://wiki.debian.org/Java/Packaging>
- ▶ <https://www.debian.org/doc/packaging-manuals/java-policy/>
- ▶ <http://pkg-java.alioth.debian.org/docs/tutorial.html>
- ▶ Paper and slides from a Debconf10 talk about javahelper:  
<http://pkg-java.alioth.debian.org/docs/debconf10-javahelper-paper.pdf>  
<http://pkg-java.alioth.debian.org/docs/debconf10-javahelper-slides.pdf>

## ❷ Download IRClib from <http://moepii.sourceforge.net/>

## ❸ Package it

## Step by step...

- ▶ `apt-get install javahelper`
- ▶ Buat sebuah paket dasar source: `jh_makepkg`
  - ▶ Librari
  - ▶ None
  - ▶ Default Free compiler/runtime
- ▶ Look at and fix `debian/*`
- ▶ `dpkg-buildpackage -us -uc` Or `debuild`
- ▶ `lintian`, `debc`, etc.
- ▶ Bandingkan hasil yang Anda dapatkan dengan paket source `libirclib-java`

# Praktek sesi 4: memaketkan Ruby gem

- 1 Take a quick look at some documentation about Ruby packaging:
  - ▶ <https://wiki.debian.org/Ruby>
  - ▶ <https://wiki.debian.org/Teams/Ruby>
  - ▶ <https://wiki.debian.org/Teams/Ruby/Packaging>
  - ▶ `gem2deb(1)`, `dh_ruby(1)` (in the `gem2deb` package)
- 2 Create a basic Debian source package from the `peach` gem:  
`gem2deb peach`
- 3 Improve it so that it becomes a proper Debian package

## Step by step...

`gem2deb peach:`

- ▶ Unduh gem dari [rubygems.org](http://rubygems.org)
- ▶ Creates a suitable `.orig.tar.gz` archive, and untar it
- ▶ Initializes a Debian source package based on the gem's metadata
  - ▶ Named `ruby-gemname`
- ▶ Tries to build the Debian binary package (this might fail)

`dh_ruby` (included in *gem2deb*) does the Ruby-specific tasks:

- ▶ Build C extensions for each Ruby version
- ▶ Salin berkas ke direktori tujuan
- ▶ Update shebangs in executable scripts
- ▶ Run tests defined in `debian/ruby-tests.rb`, `debian/ruby-tests.rake`, or `debian/ruby-test-files.yaml`, as well as various other checks

## Step by step... (2)

Improve the generated package:

- ▶ Run `debclean` to clean the source tree. Look at `debian/`.
- ▶ `changelog` and `compat` should be correct
- ▶ Edit `debian/control`: improve `Description`
- ▶ Write a proper `copyright` file based on the upstream files
- ▶ Membangun paket
- ▶ Bandingkan paket Anda dengan paket `ruby-peach` di arsip Debian

## Praktek sesi 5: memaketkan modul Perl

- 1 Take a quick look at some documentation about Perl packaging:
  - ▶ <http://pkg-perl.alioth.debian.org/>
  - ▶ <https://wiki.debian.org/Teams/DebianPerlGroup>
  - ▶ `dh-make-perl(1)`, `dpt(1)` (in the `pkg-perl-tools` package)
- 2 Create a basic Debian source package from the `Acme` CPAN distribution:  
`dh-make-perl --cpan Acme`
- 3 Improve it so that it becomes a proper Debian package

## Step by step...

`dh-make-perl --cpan Acme:`

- ▶ Unduh berkas tarball dari CPAN
- ▶ Creates a suitable `.orig.tar.gz` archive, and untars it
- ▶ Initializes a Debian source package based on the distribution's metadata
  - ▶ Named `libdistname-perl`

## Step by step... (2)

Improve the generated package:

- ▶ `debian/changelog`, `debian/compat`, `debian/libacme-perl.docs`, and `debian/watch` should be correct
- ▶ Edit `debian/control`: improve `Description`, and remove boilerplate at the bottom
- ▶ Edit `debian/copyright`: remove boilerplate paragraph at the top, add years of copyright to the `Files: *` stanza

# Alih Bahasa
